Single Neuron - is just a function

neights - how much influence a specific input has

bias -> how much influence the neuron has

5 positive bias: small input -> big output

4 negative bias, vice versa -> neuron less important / influence

activation functions - allow to capture and model complex non-linear velationships within impuls. Lo enabling to learn & generalize from complex data

- any growing function is possible

-> but some non-linear are necessary or neural net is suct an linear regression

examples
